English Abstract
  A method and system for tracking subscriber use of a network, such as an
  interactive media delivery network, which delivers programming to set top
  boxes coupled to a display device is disclosed. The system tracks events,
  including any change in status of a set top box caused by a change in
  programming or channel or a subscriber's activation and interaction with
  a particular interactive services application. Each application forms an
  event record comprising the application ID, event and time stamp.
  Collected event records are buffered, compressed, formed into packets and
  transmitted to a merge processor that combines event records with content
  data that describes the programming content distributed throughout the
  network. The event records and content data are merged to form event
  timelines for each subscriber's set top box that show subscriber activity
  or programming played to a subscriber over a selected time period.

Publication Language: English
Fulltext Word Count: 12628

English Abstract
  Dynamic programming of a digital entertainment terminal (DET)
  facilitates operation of the terminal to offer a variety of functionally
  different broadband services. The terminal can be reprogrammed, as
  needed, for each different service offered by one or more information
  service providers. The terminal includes a network interface module which
  couples the terminal to a specific type of communication network for
  receiving a digital broadband channel and providing two-way control
  signaling communication between the terminal and the network. The
  terminal also includes a control processor with a program memory. The
  control processor receives user inputs and controls operations of the
  terminal and sending and receiving of control signals over the two-way
  control signaling channel. The program memory stores data received over
  the digital broadband channel as software executable by the control
  processor. The audio/video processor converts compressed, digital
  information received over the broadband channel into signals for driving
  an audio/video display device, such as a standard television set. The
  control processor executes the software received and stored in the memory
  to control subsequent operations of the terminal, including at least some
  operations of the audio/video processor and at least some responses to
  user inputs.
